

1 and Virginia and Florida. She is the head of the Texas
2 State Library and Archives Commission.

3 There are many divides it is clear to me and to
4 everybody else at this point. The digital divide has many
5 components. There are many divides and there are many
6 bridges. Divides include CPE. They include infrastructure,
7 training, education, cost. And these bridges will take many
8 forms and come from many sources.

9 And the most -- I suppose the most hopeful source
10 is going to be found in combinations of efforts that are
11 found in the public-private partnerships that we hear so
12 much about. And with that, I will turn to Rick Carlisle to
13 discuss with us some of those partnerships from my home
14 state. Thank you, Rick.

15 SECRETARY CARLISLE: Well, thank you, Chairman
16 Sanford. It is a pleasure to be here. And I do have a
17 Power Point presentation. But I am not going to use it
18 because in the interest of time, I am going to skip around
19 quite a bit. So I don't think it would be -- it might be
20 more distracting than helpful. But I think it is in the
21 packets.

22 It may be quite odd to see a Secretary of Commerce
23 here talking about telecommunications issues. Our
24 Department is structured a bit differently. We do have all
25 of the traditional economic development activities that are

1 in most Departments of Commerce in most of your states.

2 We also have most of the regulatory commissions.

3 So actually the Utilities Commission is a part of the
4 Department, although loosely attached; does not report to
5 the Secretary. But it is a part of the overall structure of
6 the Department.

7 Perhaps more germane, we have the state's
8 Information and Telecommunications Services. So the
9 Department actually runs the state's telephone system and
10 runs the state's computer system. We don't actually have,
11 of course, a state-owned system. But what we do is
12 aggregate and negotiate contracts so we get far lower rates
13 and better services than you would otherwise obtain.

14 We also provide the policy support to the
15 Information Resource Management Commission which is the
16 state's Technology Policy Commission. And that includes a
17 lot of telecommunications policies. And I chair the E-
18 government task force which is charged with putting state
19 services on-line with a very aggressive rule-out process.
20 And I will talk about that a bit more in a moment.

21 Given the shortness of time, I really want to
22 touch on three things in terms of public-private
23 partnerships. First is a bit more historical. About 12
24 years ago, the state embarked on a process to create what we
25 called then the North Carolina Information Highway. And

1 that was a decision that we would have high speed switching
2 and fiberoptic cable available throughout North Carolina.

3 We did that through a partnership with the state's
4 major telephone companies which in essence said the state
5 would provide the customer base if they would provide the
6 infrastructure. There was an aggressive roll-out of fiber
7 and high speed ATM switches. And what the state did was
8 deploy the infrastructure in community colleges,
9 universities, public schools and other places to create
10 centers in those public institutions, provide the customer
11 base.

12 The roll-out probably was never quite as
13 widespread as we had hoped. The customer base didn't
14 materialize in part because we bet on the wrong technology.
15 And not necessarily the wrong technology at the time, but
16 the technology that seemed the best to provide high broad
17 band and a wide array of services. I think that has taught
18 us that a lot of solutions now will have to be technology
19 neutral; that technology can change so rapidly, you can't
20 project what the customer may need; that in these
21 partnerships, you have to rely upon a more flexible method
22 of determining the technology.

23 We have since modified that. That drove down
24 price, drove up usage. And what it did provide, however,
25 was one of the most I think widespread fiber networks of any

1 state.

2 The second was a more recent venture that really
3 came out of an overall look at rural North Carolina. Like
4 in a lot of states, urban North Carolina is booming. Rural
5 North Carolina is suffering for a variety of factors that we
6 don't have time to go into.

7 But Governor Hunt, the Speaker of the House and
8 the President Protem of the Senate, appointed a task force
9 chaired by former White House Chief of Staff Erskin Bowles
10 to look at a variety of rural development issues. One of
11 the key issues they identified was rural connectivity, the
12 ability to access the internet at high speeds and affordable
13 prices.

14 And they set out as one of the primary goals of
15 this task force to come up with a solution for rural
16 connectivity. We proposed a solution that had primarily two
17 avenues to it. One was working with a private sector
18 through a series of incentives and tax credits to encourage
19 them to deploy the technology in areas where they couldn't
20 make a business case without some degree of subsidy.

21 The second was a bit more controversial which was
22 the state would in essence through its own network serve as
23 a provider of last resort. As you can imagine, that did
24 stimulate a lot of conversation. We then challenged the
25 phone companies if that was not an agreeable solution, to

1 come up with an alternative solution. I think to their
2 credit they did that.

3 Now, I am going to say phone companies because
4 they were the primary technology we were working with at the
5 time. But the finally solution, again, ended up being
6 technology neutral.

7 In April, we announced an agreement by the states
8 of three major telcos, that they would agree to two goals.
9 One was within a one-year period to have local dial-tone
10 access the internet all across the state regardless of the
11 size of the community. The second goal was that within
12 three years, we would have high speed, affordable internet
13 access available through the state; high speed defined at
14 256K or better and affordable defined as no appreciable
15 difference in cost between urban and rural communities using
16 the same technology and the same levels of service.

17 They signed that agreement in April. We are now
18 working through legislation which will create a rural
19 internet access authority. That is a state-level authority
20 that has a statutory requirement to do whatever is necessary
21 to accomplish those goals in a three-year period. And it
22 lays out on a statutory basis and sets those goals, in
23 essence, in state law and state policy.

24 We were then somewhat lucky. And luck always
25 helps. Another state public-private partnership was created

1 some 20 years ago, MCNC, which was the initiative to build
2 the technology infrastructure of the state, jointly funded
3 by the state and the private sector, and to engage in
4 research and the deployment of technology including
5 telecommunications technology.

6 They had become a semi-private entity. They
7 rolled out a new company. That company was acquired with a
8 large windfall. And that organization which, again, had
9 been incubated by the state was now a private sector
10 company. It agreed to pay 30 million dollars back to the
11 state to help wire rural North Carolina. So that gave us
12 both the internet access authority, the agreement with the
13 major providers, and 30 million dollars to provide subsidies
14 where needed to reach the areas where the business case
15 could not be made without a subsidy to reach them.

16 Now, I do want to stress that on this authority
17 are the possible providers, as well as a segment of users.
18 So we have not only the major telcos, the ILECs, we have
19 CLECs, wireless providers, cable companies and so on. So
20 that in different areas, the technology may vary in terms of
21 the end solution. But the key is that we do have the
22 statewide goal, the oversight authority to make that happen,
23 the agreement by the major providers to accomplish those
24 goals in the time period; and then finally, that we have the
25 subsidy of 30 million dollars as needed to go into specific

1 situations and do what may be necessary with that subsidy to
2 provide the technology.

3 A final piece I want to mention is our NC At Your
4 Service initiative. That is an initiative launched by
5 Governor Hunt, again, in April to say that the -- if the
6 state of North Carolina is going to be encouraged in this
7 activity at the private sector level, we have got to
8 respond, as well. It was to create an E-government task
9 force to set a pretty ambitious set of goals to bring all
10 state services on-line so state citizens could access these
11 seven days a week, 24 hours a day.

12 I just last week -- we signed an agreement with
13 Anderson Consulting and Yahoo which will serve as the
14 primary designer of the portal for the state services. The
15 goal is that we will have portals that the state -- that
16 state citizens can access which will look very much like a
17 customized portal you might use if you are logging on to
18 Yahoo or MSN. So that you won't see a standard state page.
19 But then you can customize your state page based on your
20 common interest and needs.

21 Also using some push technologies so if like me,
22 you can't remember when your car registration comes due,
23 reminders can be sent. And then you can log on and register
24 your car on-line. And that service will be available by the
25 end of August.

1 We should also have credit card acceptance
2 technology available within about a month. So, again, you
3 can register and pay for it on-line. The partnership with
4 Yahoo and Anderson Consulting we think is going to be pretty
5 exciting. And we will see the first products roll out in
6 about two months. And we are really looking forward to that
7 arrangement.

8 I just want to conclude by maybe a couple of
9 observations about what this took to reach some of these
10 kinds of agreements. One is that we did try to avoid
11 finger-pointing. We really tried to work on hard
12 information where possible. And candidly, there was a
13 disagreement between us and the telephone companies about
14 whether or not there was a problem with rural connectivity
15 and whether or not the market would solve it by itself
16 within a reasonable time period.

17 We undertook what I thought was a pretty seminal
18 investigation using a request for information process
19 through the telephone companies and ended up with this
20 extensive and heavy study of what kind of technology is
21 available in every county in North Carolina, what kind of
22 wiring is in place, whether or not an ISP is there, what
23 kind of equipment is in the central offices. It is one of
24 the most detailed studies I know of, looking at actually the
25 availability of technology throughout the state. So it gave

1 us a good snapshot of what was there.

2 We also asked for short-term plans in terms of
3 rolling out DSL or other technology. So what it gave us was
4 hard data to go back and say we can now document that in
5 five counties, there is no service of any kind. In other
6 counties, there is service, but speeds are not acceptable.
7 In other counties, there is service with speeds that are
8 acceptable, but the cost is five times what it is in urban
9 areas. So we didn't have to debate the problem any longer.
10 We could focus on the solution.

11 Second was to understand there had to be some
12 mutual benefit coming out of it, that there were long
13 discussions about how we were providing benefits to the
14 consumer, but also understand the requirements of the
15 telephone companies and the other providers and ensuring we
16 weren't asking them to do something they could not do and
17 still be accountable to their shareholders.

18 And I think third was, you know, a mutual
19 agreement to participate in the solution and decision-
20 making, creating the authority and having the ILECs, the
21 CLECs, the cable providers, the wireless all part of the
22 overall authority to drive this decision home which did two
23 things I think for us. First, it put them at the table so
24 they felt they had a stake. And second, I look forward to
25 the kind of arguments that are going to take place as they

1 stare at each other across that table and try to reach a
2 common -- some consensus on what kind of service is going in
3 where.

4 And with that, Madam Chairman, I think my time is
5 up. So I will stop.

6 CHAIRWOMAN SANFORD: Thank you, Rick. And before
7 we move to the next speaker, I want to take a self-indulgent
8 moment to say that as a member -- as the Chair of the
9 Commission at home and as a member of this 706 joint
10 conference, it is becoming more and more clear to me that
11 when things happen in this area, it is because a core group
12 of really committed people believe in it and push very hard
13 for it.

14 And I will take this opportunity to tout the work
15 that Rick Carlisle, Rick Webb who is head of our ITS at
16 home, Karen Long who is here in the room, Erskin Bowles and
17 our Governor Hunt have done. There is here and in
18 Haywarden, Iowa and in the other places I have gone
19 throughout my 706 tenure, as brief as it is, I see that when
20 things move is when there is a coterie of very, very
21 committed people who have the vision and who translate that
22 into energy and action. And things happen. Progress is
23 made.

24 And so we will move with that to other members of
25 this panel who have those same kinds of experiences in their

1 sphere of influence. I will turn to Mr. Pierce.

2 MR. PIERCE: Thank you. I would like to thank
3 everyone for being here this morning. This was a rather
4 late addition. Roy Cales is the first State Chief
5 Information Officer that was appointed in Florida. And one
6 of the things that we will definitely be doing is working on
7 public-private partnerships.

8 The legislature -- and I think you have heard a
9 little bit of this already today from Joe Lacher and Julia
10 Johnson and some of the other speakers. What we have tried
11 to do in Florida with the Governor and the leaders in the
12 legislature is to present a platform, a new rewrite of the
13 information technology legislation and the policy issues in
14 the organization so that we can go further and provide
15 better access to government and interaction between citizens
16 and government and business and government.

17 Some of the things we are doing is we are trying
18 to make sure the citizens' demand for service and the new
19 electronic environment is there. As it was stated earlier,
20 the budget was provided to the legislature on a CD rather
21 than a big stack of paper. We are in the process of
22 enabling all of our public records, public information
23 available by the internet.

24 And you have heard portals a few times this
25 morning. One of the charges out of the 2000 legislative

1 session which ended in early May is that the State
2 Technology Office which is headed by the Chief Information
3 Officer for Florida will be required to establish a full
4 service portal for the state of Florida.

5 This will promote the government-to-government
6 functions which would be between agencies within the state
7 or the state and local government. It will promote the
8 business opportunities, the government-to-business and
9 business-to-government. Some of the things we are looking
10 at there is the ability to do on-line procurement so that
11 you don't have to have an envelope marked technical data and
12 cost data and sealed separately and mailed in by a certain
13 time. We will still have the certain time requirement. But
14 it is going to make it a lot of easier.

15 The citizen-to-government is the important part.
16 And I think we are trying to drive that to the point, as you
17 have heard earlier, where the license, whether it be hunting
18 license, fishing license or beautician's license will be
19 obtainable through the internet and that all of the
20 information is there.

21 Now, that presents additional challenges when you
22 develop a portal of this magnitude, is you also have the
23 opportunity or the challenge of making sure you keep privacy
24 concerns there. So that you can identify that I am who I
25 say I am when I get my driver's license. But also,

1 everybody else can't figure out who I am from the
2 information that you have on your website.

3 So these are the things that we are looking at
4 with the centralized organization. The information
5 technology in Florida will be addressed as an enterprise
6 business information technology. It will be conducted as
7 though it were a private sector business. We will provide
8 services to all of the rest of government. And we will do
9 it in a way that will be as efficient and effective as
10 possible as we move into the digital government that
11 Governor Bush and the legislative leaders foresee.

12 One of the things as we start looking to the
13 future is, you know, you always look to the past and see
14 what parts you've done. Well, my background is the
15 telecommunications side of information technology. And one
16 of the things the legislation did was identify
17 telecommunications as information technology where in
18 Florida before this, it had been telecommunications and
19 information technology. Now it is all one.

20 Our state telecommunications network, we have had
21 partners in that since partners were allowed by Judge Greene
22 a few years ago. When we talk about partners, we have
23 partners in terms of providers which are primarily the ones
24 that provide services to us. The state of Florida elected
25 in the mid-'80s to buy service rather than to own equipment

1 and own our own facilities and go into it that way.

2 We have a telecommunications budget that we pay
3 the providers each year on the order of 105 to 110 million
4 dollars. The customers that we have of that service is not
5 only the state government, but also local government, school
6 boards, nonprofit corporations that do the functions of
7 state agencies. And those are very important to the
8 functioning in Florida as we move more and more to the
9 public-private partnerships and the delivery of services to
10 the citizens.

11 One of the big projects that we are doing now --
12 and I know that the FCC will be totally aware of this one --
13 is the Florida Fiber Network which is a project to partner
14 with private companies to allow installation of fiber along
15 the limited access right-of-ways in Florida, both the
16 interstates and the turnpike to promote an additional
17 capability in telecommunications infrastructure so that we
18 can connect the rural communities as the urban communities
19 are connected.

20 And if you look at the interstates throughout the
21 state, you touch a lot of the rural communities where some
22 of the capability is not there that makes a lot of business
23 sense for some of the business people to go out and install
24 there. But if you have readily available fiberoptic cable
25 into the neighborhood or into the rural community, it is a

1 lot easier to attract someone to go in and provide the
2 service there.

3 Along with that -- and I think the next speaker
4 will talk more about our state of Florida NAP -- this fiber
5 network that is going to be along interstates and the
6 turnpike will make it where any of our business partners in
7 Florida can be virtually co-located at that NAP through this
8 network. So we are looking at a lot of things in that way
9 to be able to make Florida a key in terms of being the
10 global connector for E-business, if you want to put it that
11 way.

12 The last thing that I wanted to say is that the
13 issues that we have to deal with in the next two or three
14 years are -- have been explained to me as we will redesign
15 the entire way that Florida government works because of the
16 use of information technology. And that is a very
17 significant task. And we will need all of the private
18 partners that we can find that have expertise in the areas
19 to help us do that. Thank you.

20 CHAIRWOMAN SANFORD: Thank you, Mr. Pierce. And
21 let me note -- you correct me if my information is erroneous
22 -- but your state IT infrastructure has a staff of 4,000,
23 serves over 200,000 state users and supports more than 30
24 data centers?

25 MR. PIERCE: That is the new organization that

Heritage Reporting Corporation
(202) 628-4888

1 will be reporting to Roy Cales as of July the 1st, yes,
2 ma'am.

3 CHAIRWOMAN SANFORD: That will be reporting.
4 And -- excuse me, and it will also support over 400,000
5 users daily. So there are 200,000 in excess of the
6 governmental clients, is that correct?

7 MR. PIERCE: That is approximately true. Our
8 state telecommunications network, about 40 percent of that
9 is for local government and nonprofit and schools and
10 libraries and those type of customers that are outside the
11 state government, yes, ma'am.

12 CHAIRWOMAN SANFORD: Okay. Thank you. We will
13 hear next from Jeff Kline with Accris Corporation who has a
14 special level of expertise in E-business.

15 MR. KLINE: Thank you very much.

16 CHAIRWOMAN SANFORD: Thank you.

17 MR. KLINE: Good morning. I am going to speak to
18 you today about the Florida NAP, or Florida Network Access
19 Point, in which we hope it will soon be called the Internet
20 Coast NAP.

21 Building a NAP in south Florida will be as
22 significant to the Florida economy as building the rail
23 system was by Flagler. So we think that this is going to be
24 an economic boom to the state of Florida. We are in the
25 process of building the Internet Coast NAP. And it is

1 happening because of several logical and physical reasons.

2 The first one is because of the geographical
3 location of southeast Florida. As we all know, it sits on
4 the southeast tip. It provides a natural gateway to South
5 America, to Africa and to southern Europe to provide
6 internet traffic. So we have this natural gateway today in
7 southeast Florida.

8 Also, it is a central undersea cable landing in
9 which there is a density of undersea cable landings that --
10 for telecommunications that arrive and originate and
11 terminate in the Internet Coast or in southeast Florida.
12 Also, there is a density of internet companies in southeast
13 Florida that require this high band width. And so these are
14 some of the physical and logical reasons why there will be a
15 NAP in southeast Florida in the very near future.

16 But more than anything else, this NAP has been
17 driven by people. And I agree with your point that most
18 movements, most technology clusters are driven by people.
19 And this has been a true example of cooperation in a
20 partnership between business and public sector in which from
21 the private sector side it has been led by the Internet
22 Coast. And I will tell you a little bit about the Internet
23 Coast in a minute.

24 But it also has been cooperation amongst the
25 carriers in which we have a situation in which Epic

1 Communications came in and invested \$500,000.00 just to do a
2 feasibility and a planning report on should there be a NAP
3 in southeast Florida. And Bell South has lended incredible
4 guidance and support towards the building of this NAP. And
5 other of our carriers have gotten involved such as Global
6 Crossings and 360 Networks and Telephonica.

7 So many of the different carriers have been
8 involved. And almost all of the internet companies and
9 technology companies have been involved with the building of
10 this NAP or getting behind this concept.

11 But it has also been about government. And in
12 this case, I think that government has found the balance
13 between regulating and stimulating the building of this NAP.
14 And it has been led by our hip E-governor, Governor Bush,
15 and by the IT task force and Julia Johnson and by the
16 gentleman that originated it, Louis Royas. And recently
17 State Senator Klein introduced and it was passed legislation
18 that would encourage and give incentives to businesses to
19 build this NAP in southeast Florida.

20 I said that I would talk a minute about the
21 Internet Coast. And the Internet Coast is about a lot of
22 things. It is about regionalism. It is about an internet
23 cluster that has developed in southeast Florida. But most
24 of all, it is about people. We are branding southeast
25 Florida "The Internet Coast" in the same way that Silicon

1 Valley was branded in 1971.

2 And we have a lot of different things happening.
3 And Florida will soon be and southeast Florida will soon be
4 a major economic E-business hub to the world. And, again,
5 the name, "The Internet Coast", is simply a brand. But we
6 have three major drivers that are behind this internet
7 cluster, this technology cluster that has developed.

8 And they are 1) -- and you heard a little bit
9 about it today -- that we are becoming the internet gateway
10 to South America. And it is being led by companies like AOL
11 South America, Yahoo South America, Yupi, El Citio and many
12 other companies that are in the business of providing
13 content and technology into South America which represents a
14 huge market.

15 Secondly, we have an ASP movement, an application
16 service provider. And south Florida is becoming the ASP
17 capitol of the world. And without boring with the umpti-
18 umph technology and what is behind it, it is if you know
19 anything about the internet the most -- one of the most
20 important technologies that has been adapted to the
21 internet. And today we have the undisputed market leader,
22 Citrix Corporation headquartered in southeast Florida. And
23 we also have 15 percent of all of the ASP companies.

24 But more than anything else, we have an
25 entrepreneurial spirit that is alive in southeast Florida.

1 I have spent a lot of time studying Silicon Valley, visiting
2 it. And as I talk, I am not comparing the Internet Coast to
3 Silicon Valley because there is no comparing anything to
4 Silicon Valley. But what I do believe is that if we were to
5 compare Silicon Valley to Michael Angelo, there is still
6 room for Leonardos and Picasos and other artists. And so
7 that is what the Internet Coast represents.

8 And more than anything else what has driven
9 Silicon Valley has been this entrepreneurial spirit and the
10 same entrepreneurial spirit we have in southeast Florida
11 today as I am sure many of the other states have. So these
12 are the three major drivers behind the Internet Coast.

13 Our four initiatives have been 1) to brand
14 southeast Florida the Internet Coast. And we have a
15 website, the internetcoast.com, which is a portal and I
16 encourage you to visit it, an information portal explaining
17 exactly what is going on with the Internet Coast. Secondly,
18 we want to increase the number of knowledge-based workers in
19 southeast Florida, that we understand that there is
20 technology and internet cluster growing in southeast Florida
21 and that we need a supply of computer-skilled workers and
22 knowledge-based workers.

23 And today I am happy to announce that business and
24 education and our universities are working closely, hand-in-
25 hand, to determine exactly what skill sets will be required

1 in the future. And our universities and our K through 12
2 are committed to providing those individuals to the
3 marketplace.

4 Third, we want to increase the amount of venture
5 capital in south Florida. And we have made a lot of
6 progress in that. And the last initiative was to build the
7 infrastructure. And we had a dream. We had a dream to
8 build a NAP in southeast Florida. And that means a lot of
9 things to us.

10 And as we thought about this dream and what this
11 vision was, the first thing we said is that it has to be an
12 open market. It has to be a public peering point where
13 secondary and tertiary ISPs, ASP and internet companies
14 could participate in high speed internet access. But it
15 also had to be state-of-the-art, private peering so that the
16 top tier carriers would have a place in which they could
17 exchange traffic.

18 And lastly, there had to be co-location where
19 companies could locate their equipment. And this had to be
20 done at a reasonable cost with state-of-the-art performance.
21 And today I am happy to announce that we are very close to
22 building the Internet Coast. When we started with this
23 vision of building the Internet Coast, people told us we
24 were crazy. They said it was the impossible dream and it
25 would never happen. Well, today I believe that the Internet

1 Coast is very close to becoming a reality. Thank you.

2 CHAIRWOMAN SANFORD: We will now hear from Lorine
3 Card who is with MediaOne conducting their Congressional
4 Affairs.

5 MS. CARD: Hi. Thank you for the invitation to be
6 here today. And having come from Washington, D.C., I wanted
7 to take the opportunity to thank Commissioner Tristani for
8 your thoughtful review of our merger with AT&T and the other
9 work that you are doing at the Commission, and go into my
10 presentation on public-private partnerships.

11 What I thought I would do is just briefly bring
12 folks up to speed as to who we are because in the southern
13 states, we provide service in Florida in three key markets,
14 Jacksonville, the Miami-Dade area and Naples. And then the
15 other states that were represented here today were not a
16 provider in; so and then go through what I wanted to focus
17 on today which is our public-private partnerships with our
18 communities, specifically with our youth and our educational
19 efforts which we are proud to present today.

20 MediaOne is a domestic broad band company. And we
21 provide video service, high speed internet access and
22 residential local telephone service over our cable plant in
23 several markets across the country which you can see on the
24 slide. We pass 8.5 million homes and have roughly five
25 million video customers, 100,000 local telephone customers

1 and close to half a million high speed internet customers
2 across the country.

3 So what we are doing is obviously we are embarking
4 upon a very aggressive upgrade and rebuild strategy to
5 provide these services in all of our markets and all of our
6 franchises. We are a locally franchised business. So we
7 are just about three-quarters of the way there. It is a
8 6.5-billion-dollar investment that we have been making and
9 will continue to make until the job is 100 percent done.

10 Several years ago, actually in the '80s, MediaOne,
11 then known as Continental Cable Vision, was one of the
12 founding members of a program called Cable in the Classroom
13 which is a program that we bring commercial-free,
14 educational programming to schools in the communities that
15 we serve free of charge.

16 And what we have done over the years is bring that
17 connection into the school and train teachers and then hope
18 that they use the technology. And that is one of the things
19 that over the years, you know, if you bring technology to a
20 community and to a school, you obviously want it to be used.
21 And in the early years of Cable in the Classroom, we found
22 that without teacher training and professional development,
23 it was technology that just was not going to be used unless
24 we got in there and trained people on how to use it.

25 Well, to extend that further, we have now

1 connected over 6,000 schools across the country. And 450 of
2 those schools are in Florida, the markets that we serve.
3 Well, to bring that further, once we started launching our
4 high speed internet product, branded Road Runner, we also
5 decided that it was appropriate to offer it to schools in
6 the community within the same time frame that we were going
7 to launch it commercially to consumers.

8 So within a year, we have made the process very
9 easy for schools to participate because, again, I can't
10 stress enough that it is important for our children to --
11 they know the technology better than most parents do anyway.
12 So bringing it into the schools and then training the
13 teachers to use it has been a high priority of ours.

14 It is up to the schools whether or not they want
15 the technology or not. So we work with the school
16 administration in each community. And, again, it is up to
17 them if they want to use it.

18 The schools that have this service, we are finding
19 that they are being quite innovative in how they use it. It
20 is a high speed connection. We can network up to 100
21 computers within a school or a school campus per location.
22 So it is not just one computer sitting in the library.
23 Depending on what the school wants and how they want it --
24 how they want to wire, whether it is their classrooms or
25 their computer labs, we work with each individual community

1 and their needs.

2 There is on-line -- there is e-mail. There is web
3 support. There is -- we give them space for school websites
4 and the like. And then once again, a professional
5 development. We have connected over 1,200 schools across
6 the country and 308 in Florida.

7 And one of the most successful projects we have
8 worked on in Florida is in Duval County up in Jacksonville
9 where we have worked with the county government in creating
10 a virtual private network, connecting all of the schools in
11 the county with the school headquarters so that
12 administrators and teachers can exchange data, exchange the
13 administrative records, grades, things like that over this
14 virtual private network. And that is -- and that connects
15 156 schools in that county. So it is a very successful
16 public-private partnership that we worked on with the county
17 in this case.

18 Some of the other efforts we have embarked upon as
19 a company include, okay, we bring the technology to the
20 schools. Well, there is other citizens in the communities
21 that we serve that would like to have access to the
22 technology, may not be ready to take the leap and purchase
23 it or may not have a computer at home which was addressed in
24 the last panel quite extensively.

25 So we have approached it several different ways.

Heritage Reporting Corporation
(202) 628-4888

1 One way was what we call our COOL Bus, Community Outreach
2 and On-line Learning, where we have a mobile internet
3 training lab. We actually have three of them that we bring
4 into communities, cities, smaller areas, rural areas. And
5 we set up these mobile internet labs and train community
6 citizens.

7 We have brought them to senior centers. We have
8 brought them to community centers, libraries, as well as
9 schools. And it is an effort to train those in the
10 community that may not have the access today. We also
11 encourage our employees in the communities that we serve to
12 volunteer in their schools.

13 Many of our employees are parents themselves and
14 have children in classrooms. And we encourage them to
15 volunteer their time in their child's classroom or any
16 child's classroom. And we provide up to \$600.00 annually
17 for that employee to give to the class to purchase equipment
18 and help purchase equipment for the classroom technology,
19 computers, whatever they wish to use it for.

20 The last part of our Community Outreach and On-
21 line Learning component is rewarding teachers for actually
22 using the technology. As I mentioned, if you bring the
23 technology into schools and no one uses it, it is really no
24 good for anybody. So we reward educators each year in the
25 areas that we provide the service and give them a \$10,000.00

1 grant.

2 And we have -- we had three teams in Florida that
3 this year received that grant. We have 16 teams across the
4 country that can win each year. And they can use that grant
5 to bring technology back to their schools, as well.

6 Very briefly, I wanted to highlight another
7 partnership we had last year with the White House Office of
8 National Drug Control Policy. They have embarked upon a
9 very aggressive strategy to address youth and drugs. And so
10 what we did is we have our -- what we call cub reporters
11 which are students in our communities that act as reporters
12 and journalists.

13 And it started down here in Miami and went through
14 Jacksonville, Atlanta and Richmond. And these kids went to
15 malls, to teen centers, boys and girls clubs and talked to
16 kids, interviewed them about drugs and the issues that they
17 face as teens in these cities.

18 We produced a documentary on the program,
19 presented to General Macafry of the White House Office of
20 National Drug Control Policy. But we also took it a step
21 further and shared it with all of the schools in our service
22 area so that they could use it. It is particularly
23 appropriate in the middle schools where teen drug use is a
24 problem. We also locally aired the program to reach others
25 in the community.

1 The last partnership I wanted to talk to you about
2 is actually something that started in Los Angeles and we
3 hope to bring to other cities across the country. And that
4 is called Broad Band Stories Communities in Focus. And,
5 once again, it is an effort to bring youth in the
6 communities into in this case boys and girls clubs that we
7 have wired for no charge, to bring kids into the community
8 centers and using technology.

9 And, again, it sounds very similar to a previous
10 discussion today with the Seed Centers and things like that.
11 And we have created this website called streetscene.net.
12 And kids are taking pictures and stories of their
13 communities and putting them up on the web. And it is a
14 community effort. And we hope to bring it to other
15 communities across the country.

16 So I hope I didn't take too much time here today.
17 But we find that especially in the area of education,
18 public-private partnerships work quite well.

19 CHAIRWOMAN SANFORD: Thank you, Lorine. Those are
20 some splendid examples of corporate contributions. And I
21 would like to ask before you leave here today whether that
22 film about drug usage is available in North Carolina. That
23 sounds very interesting.

24 MS. CARD: We will work to bring it there.

25 CHAIRWOMAN SANFORD: Okay. Thank you. Schools

1 and libraries were targeted in the Federal Act for special
2 attention for the obvious reason that they have enormous
3 potential for disseminating the benefits of these
4 technologies to large parts of our population. Peggy Rudd
5 from the Texas Library Association is here today to talk to
6 us about some of those activities in Texas.

7 MS. RUDD: Thank you. Commissioners and joint
8 conference members, it is a privilege for me to appear
9 before you today to talk about the importance of deploying
10 advanced telecommunication services in a reasonable and
11 timely manner to all regions of America and to our nation's
12 public libraries. My name, as you said, is Peggy Rudd. I
13 am the Director and Librarian of the Texas State Library and
14 Archives Commission and am a member of the Texas Library
15 Association and the American Library Association.

16 Public libraries are instruments of universal
17 service policy, fulfilling the policy goal of full,
18 equitable and affordable access to the richness of
19 electronic resources. Libraries not only provide access to
20 electronic information, but are providers of information, as
21 well. Libraries bring organization and structure to the
22 mass of electronic resources.

23 Public libraries provide free service to all
24 regardless of geographic location, age, education or
25 financial status. Public libraries train users to navigate

1 the electronic environment, building information literacy
2 capacity within communities. Public libraries achieve cost
3 savings through networking and resource sharing, building
4 partnerships with academic school and special libraries.

5 Public libraries also engage in a variety of
6 partnerships with public and private sector that reap
7 benefits for all. There are over 16,000 public library
8 facilities in this country. In 1995, 20.9 percent of our
9 nation's public libraries provide internet access to the
10 public. In the latest study of public library connectivity
11 conducted in 1998, that percentage had climbed to over 92
12 percent.

13 Both studies were conducted by the American
14 Library Association's Office for Information Technology
15 Policy and the U.S. National Commission on Libraries and
16 Information Science. And there is another survey underway
17 right now. The ALA Office of Information Technology Policy
18 is also in the process of evaluating the impact of public
19 library internet access on the digital divide.

20 In Texas, 97 percent of the 505 public libraries
21 provide internet access for the public. Now, these rates of
22 connectivity are the result of a great deal of hard work on
23 the part of librarians and of the successful partnerships
24 that they have forged. Hard work and partnerships have
25 brought a variety of revenue streams and other support to

1 the task of achieving the goal of full, ubiquitous access to
2 network information through our nation's public libraries.

3 Now, why is a goal of ubiquitous and equitable
4 access so important? Well, one reason is the persistent
5 digital divide. While the picture of access nationwide has
6 improved over the past five years, the so-called digital
7 divide is still very much a reality.

8 The term, of course, refers -- is the popular name
9 for the information technology gap between the haves and the
10 have nots. It is the gulf between those who have access to
11 information technology and networked information and those
12 who do not, those who can skillfully use on-line information
13 and those who cannot. And increasingly, the digital divide
14 is a factor in determining who will succeed and who will
15 not.

16 The implications of the digital divide for
17 learning and working are enormous. Houston Mayor Lee Brown
18 characterized it best when he recently said that reading and
19 using on-line information today are survival skills. In a
20 recently published book, The Digital Divide: Computers and
21 Our Children's Future, David Bolt and Ray Crawford have this
22 to say about the impact of the digital divide on the
23 educational experience.

24 And I quote, "In the world of today more than at
25 any time in the past century, much of a student's education

1 experience depends on whether or not the student has access
2 to technology, access to the information made available by
3 that technology and access to educators trained in
4 integrating that technology and information into the
5 educational experience", very much what Lorine was saying
6 about cable.

7 As the internet and the world wide web continue to
8 grow and all aspects of our society become increasingly
9 affected by information technology, the digital divide is
10 aggravated. The internet doubles in size every year. The
11 world wide web doubles in size every 90 days.

12 And in 1996, if you look at the growth of
13 electronic mail, the U.S. Postal Service, for example,
14 delivered 185 billion pieces of first class mail. In the
15 same year, the internet handled one trillion e-mail
16 messages.

17 Additionally, the faster speeds and greater
18 capacity possible through the deployment of advanced
19 telecommunications will enable advanced applications such as
20 video streaming, telemedicine, real-time interactions,
21 telecommuting on-line or E-government -- which Jeff was
22 talking about; that is certainly very important -- and
23 virtual education and learning experiences.

24 But will all regions and all Americans have access
25 to these applications? And these are the questions that we

1 have certainly heard asked by the Commissioners and joint
2 conference members today.

3 In 1997, the National Telecommunications
4 Information Administration of the U.S. Department of
5 Commerce worked through the Census Bureau to update data on
6 the digital divide. From these data, we know that
7 geographic location, income, race, age, education and family
8 structure influenced whether or not an individual has access
9 to computers and the internet. We also know that the least
10 connected are the rural poor, rural and central city
11 minorities, young households under age 25, and female-headed
12 households.

13 Public libraries have provided information access
14 in this country for over a century. We are not new to this
15 game. Making broad band and advanced capabilities available
16 to the public in libraries simply expands the tools that
17 libraries can offer to people to support their information-
18 seeking and life-long learning activities.

19 Public libraries are integral to community and
20 economic development and are a crucial asset in community-
21 building. So it is only natural that they would take the
22 lead in promoting access to networked information and
23 computing resources for those who do not otherwise have that
24 access.

25 People already turn to the public library

1 resources for educational enrichment, job and career
2 information, college preparation, literacy instruction and
3 so forth. Libraries are uniquely positioned I think to be
4 one-stop shops. It is what I call the library beyond walls,
5 not necessarily the library without walls.

6 Public librarians can also give technology a human
7 face. While the information available on the web grows
8 exponentially, untutored individuals can find searching for
9 meaningful, relevant information very frustrating.
10 Additionally, once ubiquitous deployment of advanced
11 telecommunications takes place, the affordability of access
12 for all Americans becomes a serious issue. Thus, there is
13 an enormous role for librarians and libraries to play in
14 building capacity in individuals and communities for
15 equitable access and success in the networked information
16 environment.

17 Now, what will libraries need in order to address
18 the digital divide? First and foremost, broad band must be
19 deployed to all regions of the country in a reasonable and
20 timely manner in order to -- in order for libraries to
21 provide access. We are not talking about ten years from
22 now. Frequently, grants have been used to install
23 technology and telecommunications infrastructures in
24 libraries. But these infrastructures must be maintained.

25 While the national E-rate program has certainly

1 helped defray costs through available discounts, requests
2 for discounts are out-stripping the E-rates ability to meet
3 all demands for support. And E-rate will not provide
4 support for the critical element required in the networking
5 infrastructure, public desk-top computers.

6 Thus, libraries must plan for upgrades and
7 replacements in the normal course of budgeting or seek other
8 support. For libraries with limited sources of income and
9 staffing, these are challenges that are frequently difficult
10 to meet. National, state and federal -- national, state and
11 local partnerships help libraries meet those challenges.

12 In Texas, libraries have taken full advantage of
13 partnerships that ensure the public's access to networked
14 information. Born of telecommunications deregulation in
15 1995, the Telecommunications Infrastructure Fund, or TIF
16 board has provided over 20 million dollars of assistance to
17 public libraries in computer hardware and software, internet
18 services, high speed telecommunications and training. Of
19 the 789 total public library outlooks in Texas, TIF has
20 provided grant assistance for 656.

21 Most recently, the TIF board has partnered with
22 the Texas State Library and Archives Commission, my agency,
23 to establish the Library of Texas, a statewide virtual
24 library that we are very excited about. The Library of
25 Texas will deliver information when, where and how Texans

1 want it by providing on-line databases, putting thousands of
2 full textbooks, reference materials and journals on the
3 desk-top, current and retrospective government information,
4 extensive training and a statewide catalogue. The TIF board
5 has pledged 20 million dollars for the first two years of
6 this project and plans to also support years three and four.

7 Certainly, the Bill and Melinda Gates Foundation
8 has committed substantial resources to addressing the
9 digital divide. And through their statewide partnership
10 grant initiative in Texas, over ten million dollars will --
11 in assistance in hardware, software, ongoing technical
12 support will be available to Texas public libraries over the
13 coming year. And part of the statewide partnership
14 initiative is for the Gates Foundation to make labs --
15 computer training labs available in 22 of the largest public
16 libraries in the state.

17 The Tocker Foundation, which is a private
18 foundation, has also supported those libraries that are in
19 rural areas. Their principal focus is on libraries that
20 serve populations under 25,000, so a little larger than the
21 2,500 that Commissioner Perlman was talking about earlier.
22 But nonetheless, they have been a tremendous boom for those
23 small, struggling -- frequently struggling rural libraries.

24 Another exciting example of partnerships that are
25 aiding public libraries in providing access and addressing

1 issues of the digital divide is a recent donation of
2 \$500,000.00 by the Susan and Michael Dell Foundation to
3 Austin Public Library. Austin has the distinction of being
4 considered one of the most wired cities in the country.
5 However, there is a wide gap between the information haves
6 and have nots.

7 Recently, the Wired For Youth Center was opened
8 and this is the first of a series of real community access
9 centers at the Oak Springs Branch Library. And hundreds of
10 community residents were in attendance. And as Susan Dell
11 cut the ribbon, there were children at all of the computers
12 cutting a virtual ribbon. And afterwards, children stood
13 literally five deep waiting their chance to get their chance
14 to get at the computers.

15 Local public libraries I think have worked very
16 hard to leverage these partnerships to gain resources to
17 help support their efforts. And they will continue to
18 partner with funding bodies and organizations and
19 institutions with allied interests in order to maximize
20 impact. Libraries have been a part of resource sharing
21 networks since 1960. So that is not really anything new for
22 us.

23 The E-rate program is an important component of
24 the multi-faceted support for full, ubiquitous public access
25 to networked information. But it is only a beginning. One

1 of the things that we would like to see is certainly a
2 nationwide cadre of loaned executives from
3 telecommunications and technology firms to public libraries
4 and schools. These experts on loan could
5 lead training efforts, assist in developing E-rate and grant
6 proposals, assist in crafting technology plans and help
7 libraries and schools capitalize on the digital revolution.

8 I believe that public libraries are a part of the
9 piece -- probably the most important part of the puzzle that
10 will get services out to those in rural and high-cost areas
11 and certainly are part of the issue of building interest and
12 building momentum in those communities. Thank you very much
13 for the opportunity to speak with you today.

14 CHAIRWOMAN SANFORD: Thank you, Peggy. Are there
15 questions?

16 COMMISSIONER TRISTANI: I had a question of Mr.
17 Kline. And excuse my ignorance, but I am not familiar -- or
18 as familiar as I should be with south Florida. And I wanted
19 to hear a little bit more about the Internet Coast and how
20 it is a public-private partnership, if that is what it is.
21 And I heard you say that there were four things that you
22 were doing. And you ended with the infrastructure. But who
23 is this infrastructure going to benefit? I mean, can you
24 tell me a little bit more about it so I have a sense of what
25 you are attempting here?

1 MR. KLINE: Thank you very much. And please allow
2 me this opportunity to evangelize the word about the
3 Internet Coast. So, first of all, the Internet Coast, we
4 had this internet and technology cluster developing in
5 southeast Florida. And it was really happening on its own.
6 And a lot of -- probably six to ten of us entrepreneurs got
7 together and we started to see this. And we started to say
8 there needs to be some growth management to this.

9 And first and foremost, it needs to have an
10 identity. And we need to create an identity for this
11 movement. And we came up with the name, "The Internet
12 Coast." And so that was the birth of it.

13 And then we all started to do a lot of speaking
14 engagements, getting involved with government, with the
15 chambers, with all of the EDO-type organizations, and
16 started to really define what this internet and technology
17 movement -- what was driving it and what could we do to help
18 the cause. To date, the Internet Coast has been done
19 without one single taxpayer dollar.

20 It has been totally driven by the private sector
21 in which we have gotten together and with the private sector
22 umbrella brought government together and worked with them
23 very closely. Yet government has given us the ability to --
24 they have encouraged our growth without overly regulating
25 the growth. And from that, as I said, we identified four

1 initiatives today. And these initiatives are growing.

2 But the first one was the branding. And that is
3 that we want worldwide awareness as to this internet
4 movement and exactly what is happening. The second is that
5 as this technology or internet movement continues to grow,
6 we saw that there would be a need for the labor supply, the
7 computer skilled worker, the knowledge-based workers. And
8 it is very difficult to bring talent in from around the
9 country because there is other great technology clusters
10 like Route 128, the Research Triangle, Silicon Valley,
11 Austin, et cetera.

12 So we saw the need to grow our own. And so we
13 started to get together with all of the universities. And
14 we said, you know, put aside your personal interest and
15 listen to what the work force is going to need, the labor
16 supply. And so we have been working very closely in which
17 private sector now are filling out surveys, identifying how
18 many Java programmers or C++, et cetera. And the
19 universities now are starting to develop their curriculums
20 to meet this need.

21 Again, as I said earlier, the -- I have spent a
22 lot of time studying and visiting Silicon Valley. And if
23 you were to ask me what was the main driving factor, well,
24 there was a lot. There was a paradigm shift from the mini-
25 computer to the micro-computer. There was the silicon chip

1 and Fairchild and all the spin-offs. But more than
2 anything, it was this entrepreneurial spirit that was alive
3 in Silicon Valley. And we have that exact same
4 entrepreneurial spirit alive here.

5 But it is also venture capital. And if somebody
6 has an idea, regardless to the financial background that
7 they come from, that if it is a good idea, they should be
8 able to raise money. Silicon Valley, they have 3000
9 Sandhill Road. It is a complex of four buildings. And you
10 can go there if you have -- if you live in Silicon Valley or
11 anywhere. But you are at an advantage if you live in
12 Silicon Valley. But you can go there. And 30 top-tier
13 venture capital companies are there. And if the idea is
14 worthy, you will get the funding.

15 And so we want to increase the venture capital in
16 south Florida. Several years ago there was little to no
17 venture capital funding. Today, there is significant
18 venture capital funding. And what is bringing them in is
19 not taxpayer or government incentives. It is opportunity.
20 And so that is what has brought them in. And then the last
21 was the infrastructure. And to your point.

22 And we see in order to grow this internet cluster,
23 or the Internet Coast, we need high speed internet access to
24 the businesses and to all of the consumers. We see this
25 digital divide as being a real key issue. And I think that

1 that is going to be the next major initiative from the
2 Internet Coast.

3 But, again, we started with this impossible dream
4 of bringing forth the NAP to southeast Florida. And if you
5 don't know southeast Florida, historically we have been
6 plagued factionalism and fighting amongst the counties
7 between Miami, Dade County, Broward and Palm Beach Counties.
8 And behind the Internet Coast -- and I think because it was
9 led by the private sector -- all of the different counties
10 got together. And we said where does it logically need to
11 be.

12 And I am happy to say that all of the county
13 officials, all of the organizations and private sector put
14 their selfish interests aside and said where does it belong.
15 I am from Palm Beach County. But I said that the need
16 belonged in Miami. That is where the greatest density was.
17 And that is where it belonged. And I applaud Broward and
18 Palm Beach County and all of the different organizations
19 from those counties that supported this.

20 And so I think as much as anything, the Internet
21 Coast is about regionalism and working together in
22 cooperation between the private sector and state.

23 CHAIRWOMAN SANFORD: Thank you, Jeff.

24 COMMISSIONER PERLMAN: I have a question for Rick.
25 I must say, this is a very impressive amount of information.

1 We in Texas are trying to do a similar thing. And to be
2 honest with you, we have had some problems of
3 confidentiality concerns that the carriers have. And I was
4 wondering first how you address that.

5 And then secondly, I was wondering if you give me
6 some take-aways from the information that you have put
7 together here in terms of what did you learn from doing this
8 and what came out of that in terms of solutions to address
9 whatever problems you discovered?

10 SECRETARY CARLISLE: I guess first as far as the
11 confidentiality, in terms of the information here, there
12 were some reservations, but really no significant concerns
13 expressed by the providers. So I don't know to what degree
14 it arose in Texas. I would be glad to have our Chief
15 Information Officer talk to the folks in Texas and see if
16 there are any differences there or how those are handled.

17 But in essence, it all -- once it became a public
18 document, they were providing basically what technology was
19 there. Some of these we supplemented by going to other
20 sources outside the request for information. But, again, I
21 can't directly speak to that because it was not a big issue
22 in North Carolina. But we can talk to your people in Texas
23 and determine if there was any differences.

24 In terms of take-aways, I think one of the biggest
25 problems we had was a debate over was there a problem, what

1 was the problem, at what rate would the market solve the
2 problem. And, again, as I thought through what are some of
3 the requirements for solid public-private partnerships, it
4 is agreement on the problem. If you don't agree on the
5 problem, you can't begin to address it.

6 What this gave us then was the basis for having an
7 agreement on exactly what the nature of the problem was that
8 we had to solve. And, again, what we discovered was we got
9 a full count of all the central offices across all the --
10 across the entire state, 430 I believe central offices, 103
11 of those in the target rural areas we were most concerned
12 about.

13 We got a clear picture of what kind of lines serve
14 those central offices. We got a pretty good picture of what
15 kind of equipment was in those central offices. And we got
16 a pretty good snapshot of over the next year what kind of
17 lines are going to be laid and what kind of investment was
18 going to be made that provided additional technology in
19 those areas not served.

20 So we know, for example, and we can identify the
21 counties now that don't have service, the kind of service
22 they have, the speed of the service, and in most cases the
23 price of the service. And it was even debated across that,
24 exactly what it cost if you were in a given county if you
25 wanted to get internet access. What was it going to cost a

1 business or a home user? It sounds like a simple question.
2 But it turns out it wasn't. We have much better information
3 on that now.

4 We've got one more step we've got to go which is
5 although DSL service may be available, unless you have a
6 pattern of users, you don't know how many may be outside
7 that 18,000-foot limit. So we are in the process now of
8 working with the providers to map out the users and then lay
9 them over the map that we have generated which we can
10 digitize of where DSL is so we will know what percentage of
11 users within a given area are outside the area that DSL
12 serves.

13 So either DSL may not be a solution there, it may
14 need to be extended, or in some cases, technology exists to
15 carry that a bit farther. What we can then do is put
16 together a pretty good picture of what kind of solutions
17 have to be put in place of where the existing or proposed
18 investment will solve it, where a subsidy may be needed for
19 land lines for solve it, where through a combination of
20 opening of a central office and subsidizing an investment
21 maybe by an alternative provider we can get the equipment in
22 place to do that or where it is going to have to be wireless
23 or some other solution because given the nature of the
24 community, where the technology is, you simply can't get in
25 there even at a reasonable subsidy.

1 COMMISSIONER PERLMAN: Did I understand though
2 that the carriers have basically now signed up in North
3 Carolina to provide this within three years irrespective of
4 kind of, you know, what technology is used to actually
5 deploy service? Is that kind of where you are right now?

6 SECRETARY CARLISLE: That is correct. I mean,
7 they have signed on to a three-year goal saying they will
8 provide, again, under our definition, high speed, affordable
9 internet access statewide.

10 COMMISSIONER PERLMAN: Okay.

11 SECRETARY CARLISLE: Now, they have also
12 understood the state would help subsidize in the high cost
13 areas. So our decision will be what do we subsidize. Is it
14 going to be land lines in all cases or the telcos or would
15 we say, you know, given the nature of the problem, it is far
16 better we subsidize something else?

17 COMMISSIONER PERLMAN: Right. And have you costed
18 out what the -- that might cost in terms of the commitment
19 that the state would make for --

20 SECRETARY CARLISLE: Well, what we have reserved
21 is 30 million dollars.

22 COMMISSIONER PERLMAN: Okay. But you think the 30
23 million dollars is --

24 SECRETARY CARLISLE: We think so.

25 COMMISSIONER PERLMAN: -- adequate.

1 SECRETARY CARLISLE: We think so.

2 CHAIRWOMAN SANFORD: We hope so. We are just
3 about at the end of our time. I would like to close with
4 one sort of multi-part question to Jeff. And I will ask you
5 to help me cut to the chase on this and be succinct so we
6 can close moderately on time and go to lunch. Where is the
7 nearest NAP to the one that is either being proposed or
8 being constructed? I was a little unclear.

9 MR. KLINE: Well, the closest tier one NAP would
10 be Virginia. And that is where most of the traffic right
11 now is going through. And when you look at voice-over IP
12 and the amount of traffic that is starting to come in from
13 South America, it starts to make logical and physical sense
14 to have a NAP in southeast Florida.

15 CHAIRWOMAN SANFORD: Cost of constructive of a NAP
16 is?

17 MR. KLINE: Cost of construction is a difficult
18 question. Again, the Epic report that was done, they
19 estimated that it would require 200,000 square feet to house
20 the NAP. But once the NAP is in place, then there is going
21 to be another two million square feet to house the companies
22 that will want to be as close to the NAP as they can. And
23 what I say to people is whatever you think this NAP is going
24 to do to our economy, put a 10X in front of it.

25 CHAIRWOMAN SANFORD: Okay. Thank you very much.

1 With that, I want to thank these panelists very much for a
2 lively, informative presentation. Thank you.

3 (Applause.)

4 CHAIRWOMAN SANFORD: And then I would like to turn
5 it to Commissioner Tristani to close out.

6 COMMISSIONER TRISTANI: Actually, Joe is going to
7 close it.

8 CHAIRWOMAN SANFORD: Okay.

9 COMMISSIONER TRISTANI: But I just wanted to thank
10 not just this panel, but the prior panels. I want to thank
11 my fellow Commissioners including those that had --
12 Commissioner Dixon had to leave. This has been very, very
13 valuable and informational and good for me. I wish when we
14 were in Washington, we would get as good of presentations as
15 we get when we leave Washington. And I hope you continue to
16 keep us informed, everyone that is here. And with that, I
17 will hand it over to Joe.

18 CHAIRMAN GARCIA: Well, I just wanted to close by,
19 again, thanking the Florida Department of Management
20 Services for the excellent job they have done here today, as
21 well as All Video Network which has been simulcasting this.
22 Let me just tell you, it speaks to what we were talking
23 about.

24 Since we have been here today, and the crowd, we
25 have been at 100, 120 at some points, it comes and goes.

1 But since we have began today, we have had over 14,000 hits
2 while we have been here. And at one time, we had as many as
3 600 people watching us. So it speaks to this world we are
4 headed towards. And this is that preliminary step. And we
5 have only just scratched the surface.

6 So thank you for being here today. Thank you for
7 coming to south Florida. We are going to be going -- some
8 of us have a lunch engagement. And so we will break.
9 Again, thanks to the staff for a phenomenal, phenomenal job.
10 Thank you.

11 (Whereupon, at 12:45 p.m. on Friday, June 9, 2000,
12 the hearing in the above-entitled matter was concluded.)

REPORTER'S CERTIFICATE

DOCKET NO.: N/A
CASE TITLE: FEDERAL-STATE JOINT CONFERENCE
HEARING DATE: Friday, June 9, 2000
LOCATION: Miami Beach, Florida

I hereby certify that the proceedings and evidence are contained fully and accurately on the tapes and notes reported by me at the hearing in the above case before the Federal Communications Commission.

Date: 6/09/00

Claudette Frost
Official Reporter
Heritage Reporting Corporation
1220 L Street, N.W., Suite 600
Washington, D.C. 20005-4018

TRANSCRIBER'S CERTIFICATE

I hereby certify that the proceedings and evidence were fully and accurately transcribed from the tapes and notes provided by the above named reporter in the above case before the Federal Communications Commission.

Date: 6/09/00

Bonnie Niemann
Official Transcriber
